مريم يوسف علي يوسف

Supervised by: Eng Eman

1.Business Need

Currently processes employee payroll, attendance records, and, the company pay slips manually (or using basic unstructured spreadsheets). This manual process leads to:

High potential for human errors in salary and tax calculations.
Significant delays in issuing monthly pay slips to employees.
Lack of centralized security for sensitive salary information.

Implementing an automated Payroll Management System will streamline operations, ensure accurate calculation of allowances and deductions, and enable instant digital pay slip generation.

2. Business Requirements

The system will provide the following functional features:

Employee Record Management: Store and manage basic employee details, job titles, and base salaries.
Attendance & Leave Tracking: Record working hours, overtime, absences, and deduction rules.
Payroll Processing: Automatically calculate gross salary, tax/insurance deductions, net salary, and bonuses.
Pay slip Generation: Automatically generate and export monthly pay slips (e.g., PDF format) for employees.
Reporting & Analytics: Generate monthly payroll summary reports for upper management and financial auditing.

3. Business Value

Efficiency: Reduces the time spent on monthly payroll processing by up to 70%.

Accuracy: Eliminates manual calculation errors, avoiding payroll disputes.
Employee Satisfaction: Ensures timely and transparent delivery of pay slips to employees.

Compliance & Security: Ensures all data is securely stored with role-based access control (only authorized HR/Finance staff can view payroll data).

4. Special Issues or Constraints

Data Security & Privacy: Strict privacy controls must be maintained to prevent unauthorized access to employee salary data.

Integration: The system should easily export financial summaries to standard formats (Excel/PDF) for accounting records.
